Introduction

Jade, since thousand of years a mythical stone appreciated in Far East and in the high cultures of native Americans, is currently again rising high and is sought after at auctions in Hong Kong and elsewhere.
Jade: “Piedra de ijada”

Spanish “piedra de ijada” or stone of loins (deriving from the Latin word *illa* for intestines and abdomen), based on the belief of native Indians of the Mesoamerican cultures in curing ailments of the loins and kidneys (nephritis, an inflammation of the kidneys) by these stones (Nicolas Monardes 1565).

Jade in Mesoamerican cultures

From the Olmec civilisation (1500 BCE - 400 BCE) in Guatemala a large number of highly artistic jadeite-jade carvings and objects have been recovered by archaeological campaigns.
Jade in prehistoric European cultures

Jadeite localities in the Italian Alps were the source of neolithic jadeite artefacts, traded throughout Europe.

Jade has always been a material to represent status and was considered the "Imperial Gem" from the earliest Chinese dynasties to the present. By its durability, the possibility to be carved in delicate designs and by its mere beauty, jade has become connoted with divine qualities, such as protection, longevity, health and luck in Asian cultures up to the present day (Jones 2004).

White “mutton fat” Nephrite Jade from Xinjiang

Digging for jade along the Yurungkax River (white jade river) near Hotan, Xinjiang, China.

An Imperially inscribed white and russet mutton fat jade pebble. Qianlong. Yu Ti mark and of the period, (1736-95).

Fei Cui, 翡翠

In China, the term „Yù 玉 - literally „the most beautiful stone“ – was used to describe jade, but also other hard material such as chalcedony and marble that was carved into tools and ceremonial objects since Neolithic times.

In the chinese understanding, the term jade historically was separated into the terms Ying Yù (hard jade), mostly equal with pyroxenitic jade (also known as “Fei Cui 翡翠) and Ruan Yù (soft jade), which apart from nephrite also included minerals of the serpentine group (Xiù Yù jade, Henan) (Krzemnicki 2008) and even marbles (Lantian jade, Yuchuan quarry in the Shaanxi Province).

Emperor Qianlong (1711 – 1799), the sixth Emperor of the Qing Dynasty, had a great appreciation for Burmese jadeite-jade because of its beauty and qualities.
Fei Cui, 翡翠

Promoted by the creation of an ISO standard for Fei Cui testing (HOKLAS ISO 17025; August 2006), this historic term is gaining more importance in the Asian market.

HOKLAS definition:

Fei Cui (Jadeite Jade) is a granular to fibrous polycrystalline aggregate. It is composed of jadeite as major mineral. It may consist of other minor minerals such as Omphacite, Kosmochlor, Amphibole and Feldspar.

Jade as defined by CIBJO

CIBJO: The World Jewellery Confederation

Jade is a general term describing two different minerals (jadeite and nephrite) in their massive form, as polycrystalline, quasi-monomineralic rocks. The term jade is usually used as a suffix after the mineral name.
Terms and nomenclature...

Based on historic references, the Chinese understanding of terms for jade is not equal to the Western understanding.

„Yù“ 玉
Jade

Fei Cui, 翡翠
Jadeite

Nephrite

Despite all differences, common understanding is, that jade is a polycrystalline aggregate made of fine and very densely interwoven mineral grains or fibres, thus resulting in its outstanding workable properties.

Jadeite
Chemically pure jadeite colourless (or white).

Jadeite and the Pyroxene group
The reality is much more complex!

A chemical analysis is mandatory for a mineralogical identification of jadeite!

Jadeite-Jade colour varieties:

The colour results either due to colouring elements (e.g. chromium for vivid to deep green, iron for greyish green to dark green, manganese and iron for purple to lavender colour) or due to fine dispersed inclusions (e.g. graphite for grey to black) and iron hydroxide for brown)
Nephrite has been carved since prehistoric times into artefacts and ceremonial objects, especially in China.

Nephrite is a variety name used for a rock consisting of fibrous tremolite-actinolite (amphibole group)

Tremolite \( \text{Ca}_2\text{Mg}_5\text{Si}_8\text{O}_{22}(\text{OH})_2 \)

Actinolite \( \text{Ca}_2(\text{Mg,Fe})_5\text{Si}_8\text{O}_{22}(\text{OH})_2 \)

Nephrite-Jade box designed by Cartier

Serpentinite is a “soft” rock consisting of densely interwoven submicroscopic hydrous magnesium iron phyllosilicate. It is often used for carvings.

Prehistoric stone axe, found at Lop Nor, Taklamakhan desert in the Xinjiang Province (northwestern China)

Infrared spectrometry (FTIR) to detect impregnations with oil, wax or artificial resin (polymer).

Raman microspectrometry to detect impregnation treatment in fissures and pores.
Testing of Jadeite

Test Report No. 69998
on the authenticity of the following gemstone, mounted in a ring with diamonds

- **Total weight**: approximately 29.2 grams including mounting and diamonds
- **Shape & Cut**: oval cabochon
- **Measurements**: approximately 21.00 x 16.45 x 10.60 mm
- **Colour**: green
- **Identification**: JADEITE-JADE
- **Comments**: The analysed properties confirm the authenticity of this translucent jadeite pale. No indications of any treatment. On the Asian market the jadeite-jade is usually called jadeite pale type A.
- **Origin**: Burma (Myanmar)

Burmese Jadeite

The beauty, the textures and what it tells us about its formation...
Jadeite textures

Colourless jadeite associated with multi-mineral rock maw-sit-sit, containing fine grained jadeite, kosmochlore, feldspar and zeolite minerals.

Jadeite courtesy Sikkeneast, Bangkok

Veins of intense green jadeite (chromium bearing) and veins of dark green jadeite (iron bearing) in white jadeite boulder.

Complex textures unveil a complex geological formation.
Chromium impregnation into “pure” white jadeite along pre-existing layers and primary fracture zones, followed by distinct lateral chemical diffusion and late stage brittle deformation.

Lavender jadeite is often present in larger pillow-like nodules cross-cut by folded and green chromium-rich jadeite.
Weathering results in an oxidation crust, which makes buying of rough boulders quite a challenge.

Jadeite textures

The more transparent the jadeite, the higher its quality.
